

git - the stupid content tracker

October 25, 2013

What is git?

- ▶ A revision control system that stores all history of your code in an immutable database.

What is git?

- ▶ A revision control system that stores all history of your code in an immutable database.
- ▶ Each repository is distributed. (No central servers!)

What is git?

- ▶ A revision control system that stores all history of your code in an immutable database.
- ▶ Each repository is distributed. (No central servers!)
- ▶ All interaction with a repository is done using the `git` command.

What is git?

- ▶ A revision control system that stores all history of your code in an immutable database.
- ▶ Each repository is distributed. (No central servers!)
- ▶ All interaction with a repository is done using the `git` command.
- ▶ The man pages for `git` can be cryptic; Google or Stack Overflow is usually the better option.

Sharing is caring

- ▶ Two different types of repositories: **bare** and **not** bare.

Sharing is caring

- ▶ Two different types of repositories: **bare** and **not** bare.
- ▶ Not bare repositories contain a working set of files for you to manage. Typically, only a *single* person has access to a non bare repository.

Sharing is caring

- ▶ Two different types of repositories: **bare** and **not** bare.
- ▶ Not bare repositories contain a working set of files for you to manage. Typically, only a *single* person has access to a non bare repository.
- ▶ Bare repositories contain a `git` database, but lack a working set of files. Bare repositories are typically shared with others.

- ▶ Bare repositories contain a `git` database, but lack a working set of files. Bare repositories are typically shared with others.
- ▶ We already have a lot of bare repositories in `/r/bcb/repositories` .
- ▶ We share by *pushing* and we take by *pulling*.

What is GitHub?

- ▶ Core feature: a place to store **a** bare repository that can be shared with others.

What is GitHub?

- ▶ Core feature: a place to store **a** bare repository that can be shared with others.
- ▶ Lots of other stuff: issue tracker, wiki, pretty interface, etc.

What is GitHub?

- ▶ Core feature: a place to store a bare repository that can be shared with others.
- ▶ Lots of other stuff: issue tracker, wiki, pretty interface, etc.
- ▶ Useful for sharing your code with the world, but not necessary for collaborating with others in our department.

What goes in a git repository?

- ▶ **Yes:** Source code, documentation, license, small data files.

What goes in a git repository?

- ▶ **Yes:** Source code, documentation, license, small data files.
- ▶ **No:** Executables, large data files, archives.

What goes in a git repository?

- ▶ **Yes:** Source code, documentation, license, small data files.
- ▶ **No:** Executables, large data files, archives.
- ▶ General rules. They can be broken, but be careful: once a file is committed to your repository, it can be difficult to remove from your repository's database completely.

Getting started

- ▶ Get a GitHub account.
